

## What

[Text.is](#) is a markdown pastebin service with preview, custom urls and editing. Fast, simple and free.

Markdown is a lightweight markup language with plain text formatting. It allows you to easily combine text, images, links, code snippets and more into a single article. Here is a short cheatsheet to get you started. There is also an [example](#) entry.

## Url

Optional url can be set. It goes [text.is/HERE](#). If no url was set then random url will be generated automatically.

## Edit code

Optional edit code can be set. It can be used to edit, delete or rename the entry later. You can share this code with anyone so a group of people can edit the same entry. Without this code you have no control over your entry, so remember it or save it.

## Limits

Currents limits are:

200000 characters for text field.

2-100 characters for custom url field. Must contain only latin letters, numbers, underscores or hyphens.

1-100 characters for custom edit code field. Anything is allowed here.

Some sort of rules

Don't spam, don't abuse, don't break the law. That's pretty much it.

## Duration

Your entries will be kept forever. Unless they break the rules, in which case they might get deleted. Or unless you delete them yourself.

## Views

Are updated every 10 minutes.

## Forgot my edit code, wat do?

Create a new entry instead? Do a custom edit code so you won't forget it? There is no way to recover or reset your edit code, because there is no way for me to confirm that you are the original author of the entry and not some imposter. You know, anonymity and all that.

## Etc

Hit Ctrl+Enter to submit an entry.

Click on # Headers to get permalinks.
